

Email is not meant for file transfer

Email is the most common and accessible way to send a file. Email attachments are certainly convenient; however, we have all run into size and file type restrictions. Bounced emails can lead to missed deadlines and lost productivity. Large attachments put an unnecessary strain on email servers, and traditional file transfer over FTP is slow and overly complicated.

FileCatalyst Webmail enables users to securely and reliably send large files to anybody with an email address

The ease of email with none of the restrictions

FileCatalyst Webmail is a web-based file delivery system, requiring nothing more than an email address and a web browser. FileCatalyst Webmail manages the complete file transfer process, from the user experience to tracking and storage. The system also offers something no alternative can: the ability to deliver files with FileCatalyst acceleration, improving transfer speeds by up to 100X or more.

benefits

How it Works

A user visits your website, enters the recipient's email address and selects files to send. An email notifies the recipient of the delivery, and they follow a link to a "download" button, completing the transfer. The whole process is as simple as sending an email or saving an attachment, and each transaction is tracked by FileCatalyst Webmail.

Reliable and Secure delivery

FileCatalyst Webmail detects the optimal transfer protocol from UDP(S), FTP(S) or HTTP(S), guaranteeing delivery. With acceleration enabled, files are sent up to 1000× times faster than FTP. The entire system may be secured with SSL and AES, a requirement for most security mandates. Senders are notified via email once a recipient has downloaded all the files and the integrity of the download has been verified.

The FileCatalyst Platform

FileCatalyst Webmail integrates seamlessly with our other products. Automate transfers with HotFolder, access online drop-boxes with FileCatalyst client applications, and scale easily with additional FileCatalyst Direct Servers.

- Deliver files of any size to anyone with an email address and browser
- No end user installation
- Online file sharing and collaboration
- Save time and increase productivity with accelerated transfers
- Automated email submission using FileCatalyst HotFolder
- Flexible authentication: LDAP, Active Directory, SSO, or built-in
- Customize the look and feel to match corporate identity
- Tracking, auditing and security features help meet compliance with HIPAA, SOX, GLB and other mandates
- Outlook plugin integration
- Create corporate drop-boxes to replace FTP
- API for Java and REST
- Fast and extensible search and reporting capabilities

FileCatalyst Webmail offers a simple web interface to transfer files without burdening our email servers. It's a powerful solution that fits our needs perfectly.
