Fast File Transfer on the Cloud

The file transfer tools used by most cloud providers are slow. With packet loss and latency, speeds grind to a halt, interrupted files may not resume, and delivery is not verified. The initial move to the cloud can become a long and painful operation, and once you have migrated, there are ongoing file transfer tasks to worry about. Moving to the cloud is a forward-thinking decision. Shouldn't you be using forward-thinking technology?

Hosting.com uses FileCatalyst to accelerate file transfers.

Fast, secure, reliable...and available NOW.

Letting customers “settle” is not part of the Hosting.com vision of customer service. To solve the file transfer problem, FileCatalyst acceleration is now available as a pre-installed software package across the full range of Hosting.com solutions. No specialized knowledge is required: simply select the FileCatalyst option from the customer portal, and the deployment engine will take care of the rest. Available on a per-job or ongoing basis, and with no up-front capital investment, Hosting.com offers the most cost-effective and accessible way to get started with FileCatalyst technology.

How FileCatalyst Works

The problem with the tools used by most providers is that they are based on TCP. Whether HTTP-based web uploader or full FTP server & client deployment, the underlying transport protocol slows down when there is packet loss or latency.

- FileCatalyst uses error-correcting UDP to saturate the link, transferring data through any network condition.
- Failover to multi-stream FTP or port FTP, integrity check, and retry / resume ensure reliable delivery.
- On-the-fly compression, guaranteed delivery, and file delta transfer further improves transfer efficiency

Pricing and Options

Hosting.com offers FileCatalyst acceleration in three tiers, as options for your virtual or dedicated machine:

	Lite	Standard	Enterprise
Bandwidth	45 Mbps	100 Mbps	Unlimited
Concurrent Users	5	25	Unlimited
Price	\$60 / mo.	\$120 / mo.	\$240 / mo.

- Hosting.com provides the easiest way to accelerate file transfer to the cloud
- Send and receive files up to 100X faster than traditional tools
- Manage users, connections and bandwidth usage
- Guarantee and prioritize file delivery
- Software-only solution; available from Hosting.com customer portal
- Deltas features allows huge files to be updated with small file 'partials'
- Meet security mandates like HIPPA, SOX and GLB with SSL and AES
- Supports UDP, multi-stream FTP(S), port FTP(S), HTTP(S)
- Authenticate and auto-provision with LDAP or Active Directory
- Cross-platform architecture for any server/client deployment
- email or SNMP notifications

We choose only the best of breed for each type of software and so we chose FileCatalyst as the technology for moving large files to and from our cloud service.
